WARRANTY SUMMARY*

Standard 2-Years limited parts warranty.
Standard 6-Years limited compressor warranty.

DESCRIPTION

The Multi Zone Series are ductless climate systems. They are designed with a matching indoor unit for optimum performance and efficiency. These climate systems are supported with accessories and documents to serve specific functions.

FEATURES

Variable Frequency Rotary Compressor - Twin rotary inverter compressor on all models features high efficiency operation that modulates down to 15 Hz and as high as 120 Hz for reduced vibration and quiet operation. Brushless DC motor uses powerful Neodymium magnets that are approximately 15-20 times stronger than ferrite magnets used in conventional AC compressors. The DC Inverter Control provides continuous operation, while adjusting capacity according to room temperature. The accurate sensing of cooling or heating loads prevents frequent changes in capacity and ensures efficient, economical operation.

Low Ambient Cooling Operation Down to 5 °F - This feature allows for a space to be air-conditioned even in outdoor temperatures as low as 5 °F. This cooling ability is important when dealing with server equipment rooms, surveillance mechanical rooms, restaurant kitchens, fitness centers, and more.

Load Variation Management System - The outdoor coil thermistor continuously monitors the temperature and communicates with the microprocessor. Depending on the temperature measured, the compressor will be allowed to increase the frequency if needed to meet the load or reduce frequency as the load is reduced.

High Pressure Discharge Temperature - The compressor discharge line thermistor continuously monitors the temperature and communicates with the microprocessor. Depending on the temperature measured, the compressor will be allowed to increase the frequency to meet the load or is forced to run at the current or reduced frequency. If the temperature gets excessively high, the compressor will be de-energized.

Defrost Control (Heat Pump Models) - Defrost cycle is automatically enabled if there is a build-up of frost on the outdoor coil. Outdoor fan and indoor blower operation is terminated during the defrost cycle. H1 is displayed on the indoor unit panel on the front cover during a defrost cycle.

Reversing Valve (Heat Pump Models) - 4-way interchange reversing valve effects a rapid change in direction of refrigerant flow resulting in quick changeover from cooling to heating and vice versa. Valve operates on system pressure differential between outdoor unit and indoor unit.

R-410A Refrigerant - Unit is pre-charged with R410A refrigerant that uses PVE refrigerant oil. Polyvinyl ether (PVE) is an innovative refrigerant oil specially formulated for hydrofluorocarbon (HFC) refrigeration systems. In addition to providing lubricating properties, it also has a number of other applied advantages that help to increase the reliability of the refrigeration systems where it is applied.

Refrigerant Line Connections, Service Valve - Outdoor units are designed with easy service and maintenance in mind. Maintenance points are located behind easy-access panels, to make installation and service a breeze for a trained technician. Flare connection lines are located on side of unit cabinet. Fully serviceable brass service valve prevents corrosion and provide access to refrigerant system. Shut-off valve that can be fully shut off while 2-way suction/vapor valve (with service port) may be front seated to manage refrigerant charge while servicing system.

Air Deflection Louvers - Horizontal louvers default to the cooling or heating position when the unit is operating. Horizontal louvers can be set to a preset oscillating range or fixed position from the wireless remote control. Full oscillating is the default setting when button is pushed. Vertical louvers can be manually adjusted to direct the airflow for optimal comfort.

Indoor Coil Freeze Protection - The indoor coil thermistor monitors the coil temperature continuously. Any time the coil temperature drops below 30°F, the compressor and the outdoor fan (30 seconds later) will be switched off until the coil temperature rises above 43°F and the compressor has been off for a minimum of 3 minutes.

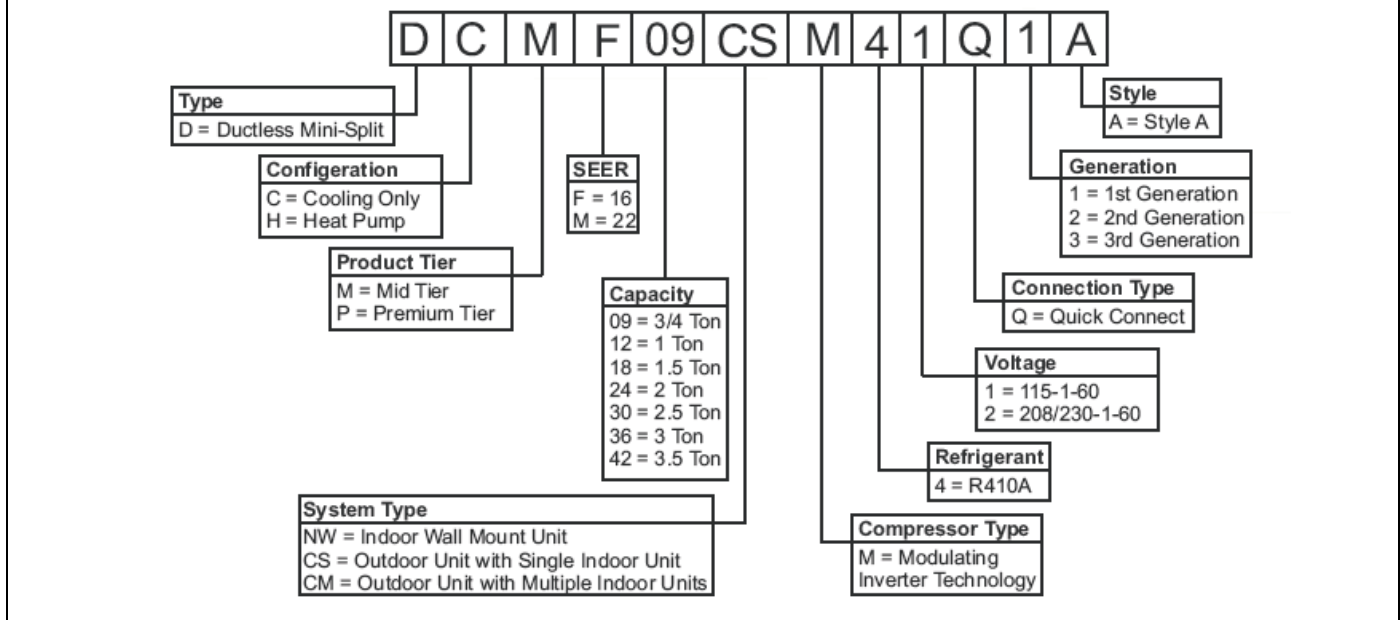

I FEEL Function - When I FEEL is activated, the system will satisfy the cooling or heating temperature set point where the remote control is located. When I FEEL is deactivated, the system will satisfy the cooling or heating temperature set point where the indoor unit is located. This feature provides homeowners with optimum comfort whether they are near or far from the indoor unit.

Hot Heat Pump (cold air prevention) - In heating mode, the indoor fan will be delayed from 1 to 3 minutes to allow refrigerant to warm up and avoid cold blow. This may occur during:

- Initial start-up of a heating cycle
- Immediately after completion of an Auto mode operation

Heating under extremely low indoor temperatures

Electrical Wiring

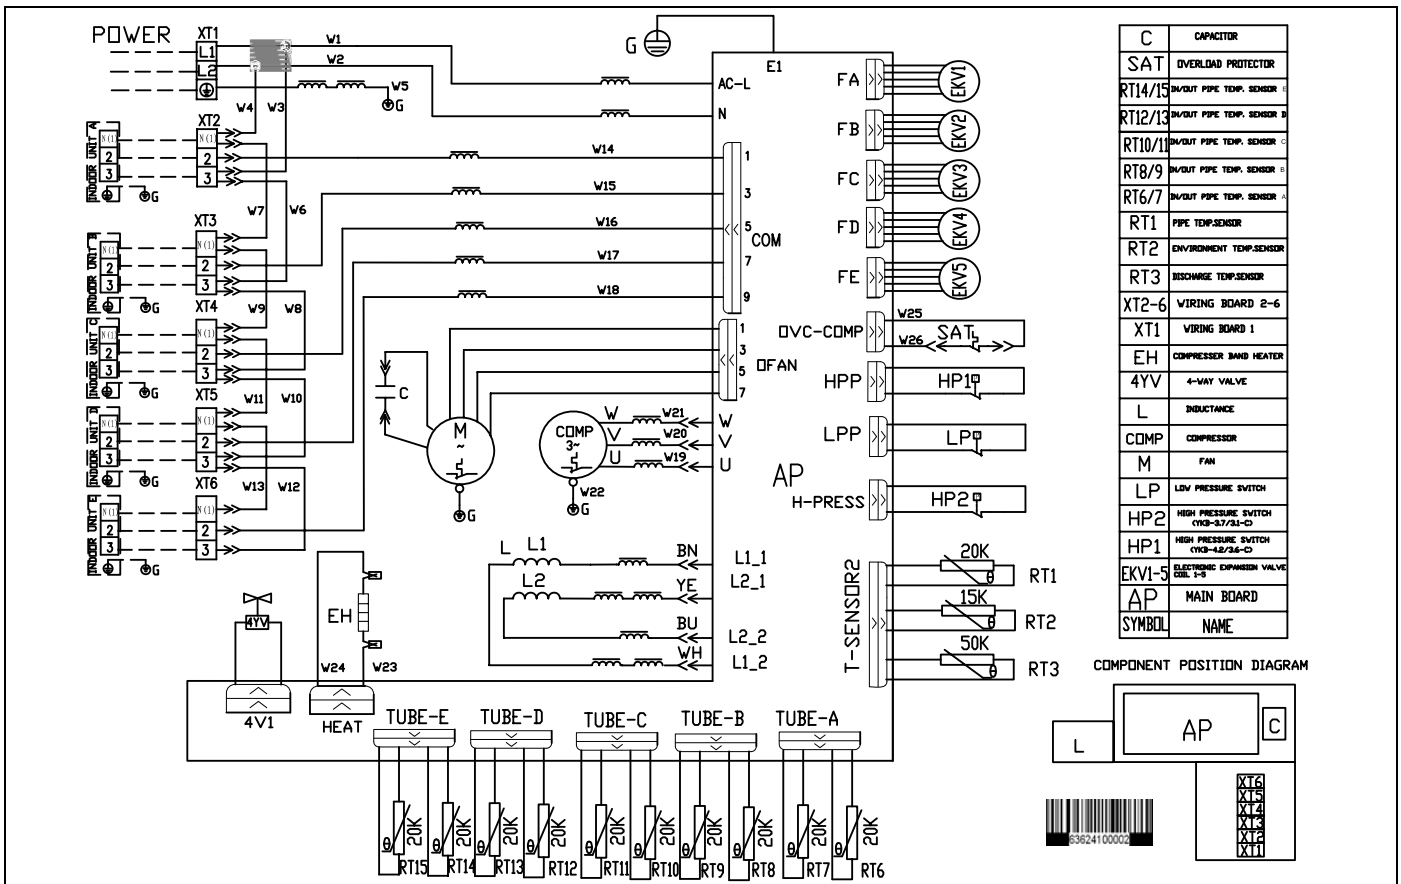

18K Outdoor Heat Pumps

24K Outdoor Heat Pumps

30K Outdoor Heat Pumps

42K Outdoor Heat Pumps

DESCRIPTION OF EACH CONTROL OPERATION

System Basic Functions

Cooling Mode

If the compressor is not running and one of the indoor units makes a call for cooling, the electronic expansion valve, the outdoor fan and the compressor start operating. When a call for cooling is satisfied, the compressor stops immediately and the outdoor fan stops running after 1 minute. In cases when some indoor units have satisfied the cooling set point temperature and some have not, the compressor does not stop running. It adjusts to a lower frequency. For the indoor unit with no cooling requirement, the corresponding electronic expansion valve closes to OP.

- Cooling Mode Switching to Heating Mode:** When the unit transfers to heating mode, the 4-way valve is energized after the compressor stops for 2 minutes. The other components react the same way described in Cooling Mode section. When the switch occurs, the 4-way valve closes.
- Outdoor Fan in Cooling Mode:** Once the compressor starts running, the outdoor fan follows after 5 seconds delay. The outdoor fan runs at high speed for the first 3 minutes then it will adjust to run at set speed. The fan will run at every speed for at least 80 seconds. When the number of running indoor units is changed, the outdoor unit will run according to sections 1.3.5.1 and 1.3.5.2. When the compressor stops, the outdoor fan continues to run at current speed and stops after 1 minute delay.

Dry Mode

- The dry conditions and process are the same as those in cooling mode;
- The status of 4-way valve: closed;
- The temperature setting range: 61 °F ~ 86 °F;

Heating Mode

1. Heating Mode:

- When one of the indoor units calls for heating operation, that indoor unit starts heating operation.
 - When all the indoor units satisfy heating conditions, the compressor stops and the outdoor fan stops 1 minute after.
 - When some of the indoor units satisfy heating conditions and other don't, the compressor reduces its frequency immediately and operates according to the required frequency load.
 - When heating mode switches to cooling mode (or dry mode) or fan mode, the compressor stops and the power of 4-way valve is shut off 2 minutes after, then the outdoor fan stops 1 minute later. The 4-way valve stays energized.
- Outdoor fan in heating mode:** The outdoor fan starts 5 seconds before the start of the compressor. It will run at its maximum speed for 40 seconds. The fan will run at every speed for at least 80 seconds. When the compressor stops, the outdoor fan stops 1 minute later.
 - Defrosting function:** When defrost conditions are met, the compressor stops, the electronic expansion valves of all indoor units are wide open, the outdoor fan stops 40 seconds after the compressor is de-energized, the 4-way valve reverses direction of the refrigerant flow, which is followed by the start of the compressor. The defrost timer is initiated and the frequency of the compressor increases to reach the defrost frequency.
 - Oil-returned in heating mode:** Oil-return happens when the system has been operating at low frequency for a long time.

When this occurs, H1 will be displayed on the indoor unit. The oil return timer in heating mode is 5 minutes.

Fan Mode

When the system is in fan mode operation, the compressor, the outdoor fan and the 4-way valve are de-energized. Temperature setting range for fan mode is between 61 °F and 86 °F.

Protection Functions

Mode Conflict Protection of indoor unit

When different indoor units have different mode settings, the system will run as follow:

- The mode of the first operating indoor unit is the basic mode. This operating mode is compared to the mode of the other indoor units to determine if there is a conflict (cooling mode (dry mode) in conflict with heating mode).
- Fan mode in conflict with heating mode. In this case, the heating mode is the basic mode no matter what mode was initiated first.

1. Overload Protection

- Cooling Overload**
 - When $T_{\text{tube}} \leq 126^{\circ}\text{F}$, the system operates normally.
 - When $T_{\text{tube}} \geq 131^{\circ}\text{F}$, compressor frequency is not allowed to increase.
 - When $T_{\text{tube}} \geq 136^{\circ}\text{F}$, compressor will run at reduced frequency.
 - When $T_{\text{tube}} \geq 144^{\circ}\text{F}$, compressor is de-energized and the indoor fan will continue to run at preset speed.
 - Heating Overload**
 - When $T_{\text{tube}} \leq 126^{\circ}\text{F}$, the system operates normally.
 - When $T_{\text{tube}} \geq 131^{\circ}\text{F}$, compressor frequency is not allowed to increase.
 - When $T_{\text{tube}} \geq 136^{\circ}\text{F}$, compressor will run at reduced frequency.
 - When $T_{\text{tube}} \geq 144^{\circ}\text{F}$, compressor is de-energized and the indoor fan will continue to run for about 30 seconds and stops.

2. High Discharge Temperature Compressor Protection

- When compressor discharge temperature is $\geq 208^{\circ}\text{F}$, compressor frequency is not allowed to increase.
- When compressor discharge temperature is $\geq 217^{\circ}\text{F}$, compressor will run at reduced frequency.
- When compressor discharge temperature is $\geq 230^{\circ}\text{F}$, the compressor will stop.
- When compressor discharge temperature is $\leq 194^{\circ}\text{F}$ and the compressor has been idle for at least 3 minutes, it will resume its operation.

3. Communication Fault

If the system fails to receive communication signals for more than 3 minutes, its operation will stop.

4. Module Protection

- Under module protection mode, the compressor will stop.
- If the compressor remains idle for at least 3 minutes, it will resume its operation.
- If module protection occurs six consecutive times, the compressor will not be allowed to start again.

5. Overload Protection

- If the overload temperature is over 239°F , the compressor will stop and the outdoor fan will stop after 30 seconds.
- If the overload temperature drops below 203°F , the compressor overload protection is reset.
- If voltage on the DC bus is below 150V or over 420V, the compressor will stop and the outdoor fan will stop after 30 seconds.

- When voltage on the DC bus returns to its normal value and the compressor has been idle for at least 3 minutes, the compressor will resume its operation.

6. Temperature Sensors Faults

Designation of Sensors	Faults
Indoor ambient temperature	The sensor is detected to be open-circuited or short-circuited for a continuous 30 seconds.
Indoor tube temperature	The sensor is detected to be open-circuited or short-circuited for a continuous 30 seconds.
Outdoor ambient temperature	The sensor is detected to be open-circuited or short-circuited for a continuous 30 seconds.
Outdoor tube temperature	The sensor is detected to be open-circuited or short-circuited for a continuous 30 seconds and no detection is performed within 10 minutes after defrost begins.
Exhaust	After the compressor has operated for 3minutes, the sensor is detected to be open-circuited or short-circuited for a continuous 30 seconds.
Overload	After the compressor has operated for 3minutes, the sensor is detected to be open-circuited or short-circuited for a continuous 30 seconds.

REMOVAL PROCEDURE

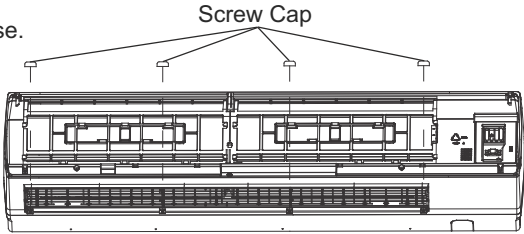

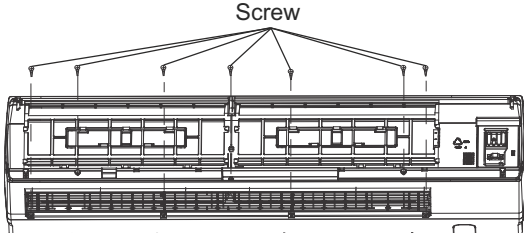

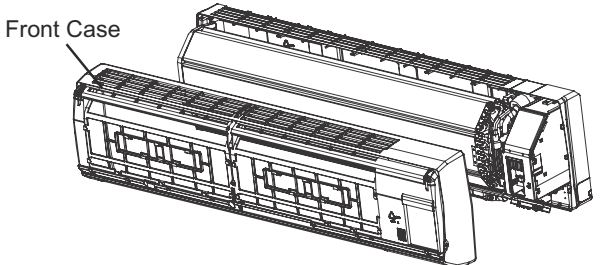

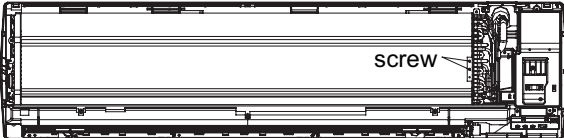

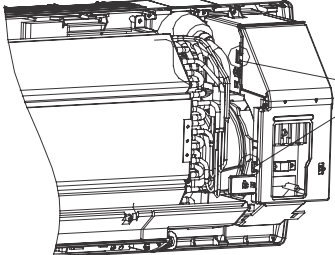

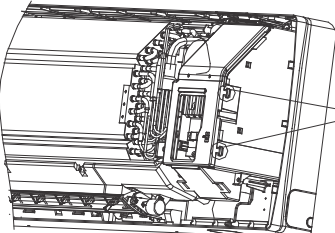

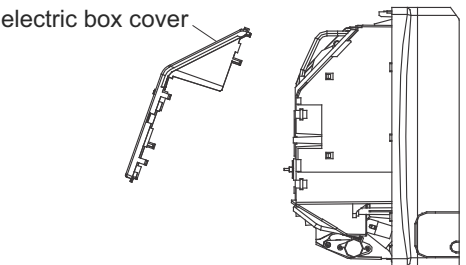

Removal Procedure of Indoor Unit

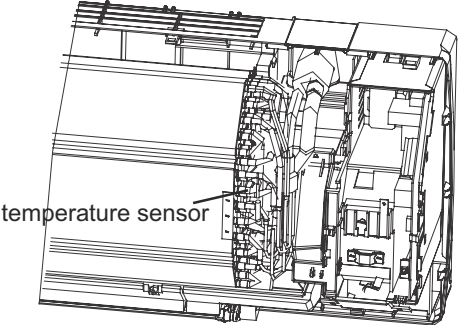

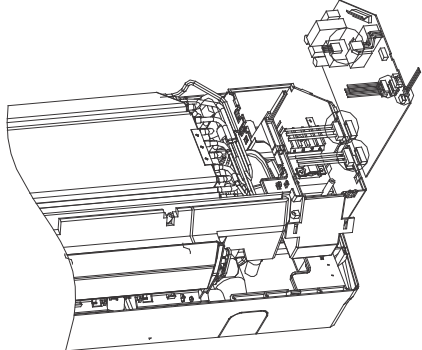

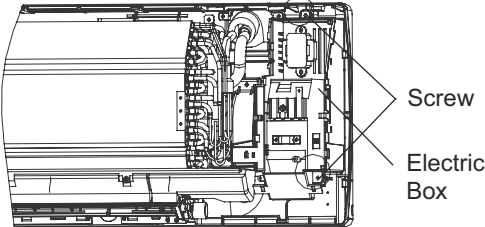

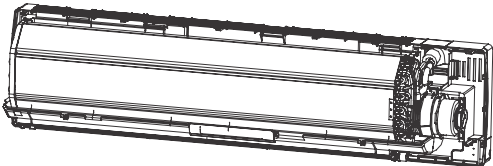

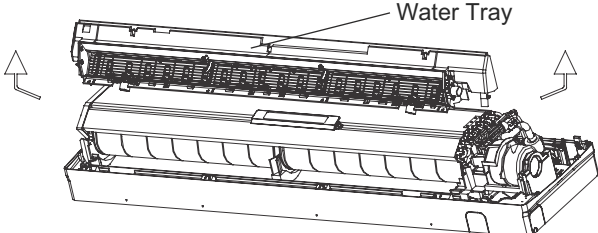

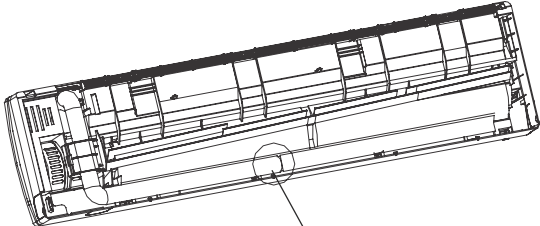

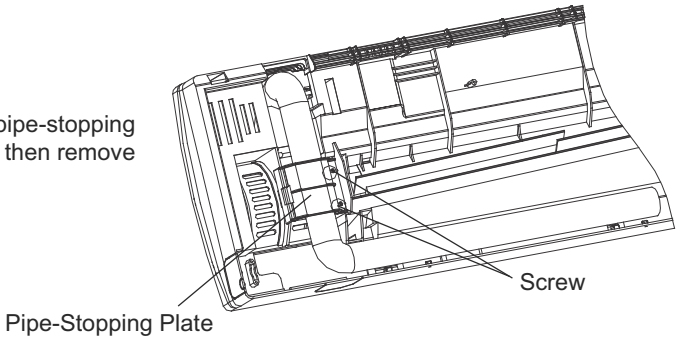

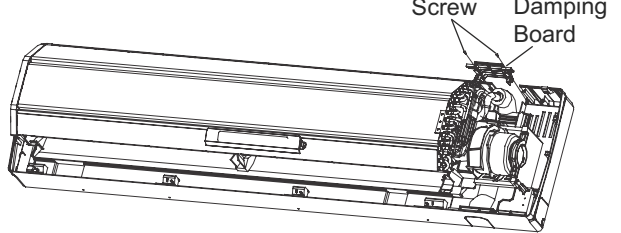

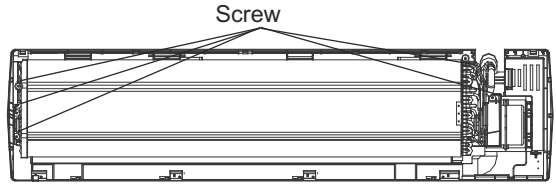

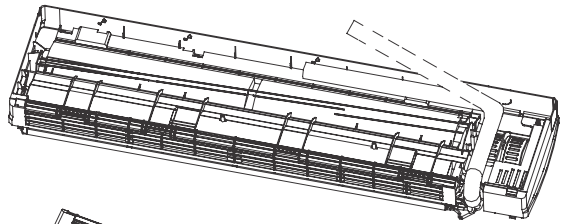

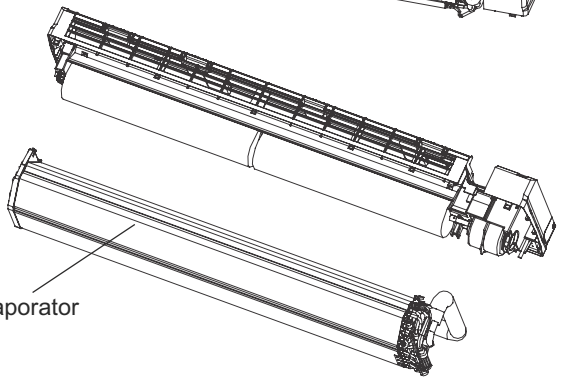

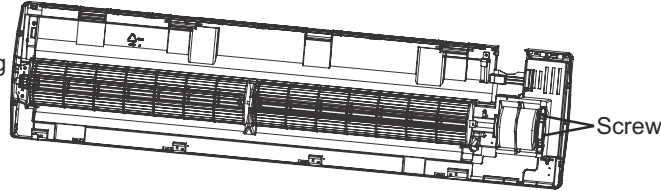

Be sure to wait for a minimum of 10 minutes after turning off all power supplies before disassembly.

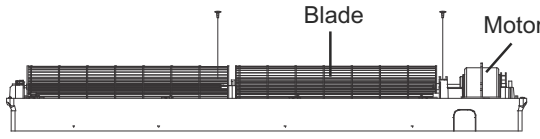

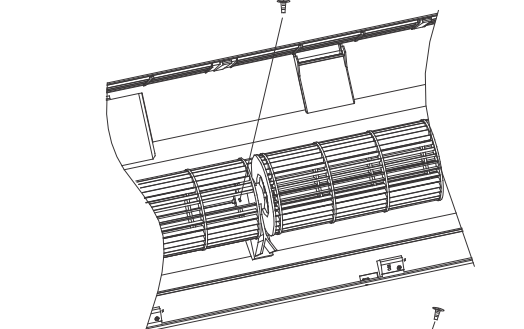

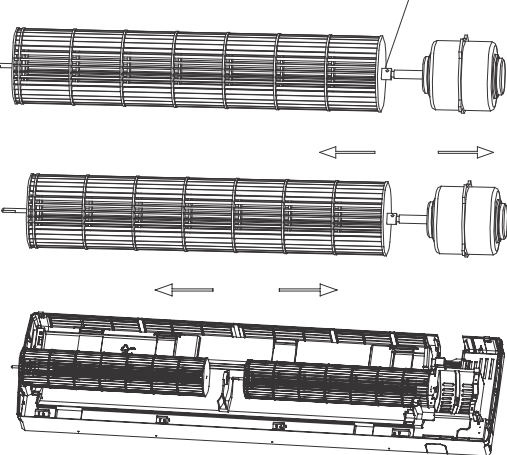

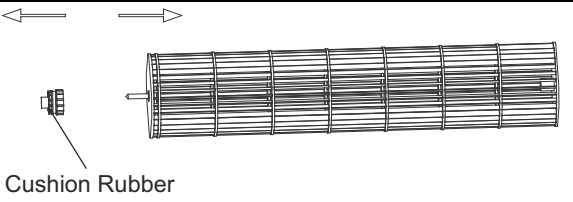

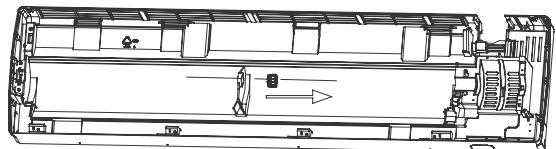

STEPS	PROCEDURES
<p>1. Before disassembly of the unit</p>	<p>Axonometric drawing for the complete unit.</p> 
<p>2. Remove filter</p>	<p>a. Open the panel.</p>  <p>b. Loosen the clasps on the filter.</p>  <p>c. Draw out two pieces of filter.</p> 
<p>3. Remove display</p>	<p>Remove 2 screws fixing display, and then remove the filter.</p> 

STEPS	PROCEDURES
<p>4. Remove panel</p>	<p>Pull the clasps at both sides slightly, and then remove the panel.</p> 
<p>5. Remove horizontal louver</p>	<p>Remove the axial bush on the horizontal louver, and then remove the horizontal louver.</p> 
<p>6. Remove top cover of electric box</p>	<p>a. Remove screws fixing the top cover of electric box.</p>  <p>b. Remove the top cover of electric box.</p> 

STEPS	PROCEDURES
<p>7. Remove front case</p>	<p>a. Remove the screw caps on front case.</p>  <p>Screw Cap</p> <p>b. Remove screws connecting the front case.</p>  <p>Screw</p> <p>c. Remove the front case.</p>  <p>Front Case</p>
<p>8. Remove earthing wire</p>	<p>Remove earthing screws, and then remove the earthing wire.</p>  <p>screw</p>
<p>9. Remove electric box cover</p>	<p>a. Loosen clasps at the left side of electric box.</p>  <p>Clasp</p> <p>b. Loosen clasps on the right side of electric box.</p>  <p>Clasp</p> <p>c. Remove electric box cover.</p>  <p>electric box cover</p>

STEPS	PROCEDURES
<p>10. Remove temperature sensor</p>	<p>Pull out the indoor temperature sensor.</p>  <p>temperature sensor</p>
<p>11. Remove electric box</p>	<p>a. Pull out 6 sockets on PCB board.</p>  <p>b. Pull out two screws on electric box.</p>  <p>Screw Electric Box</p> <p>c. Remove the electric box.</p> 
<p>12. Remove water tray</p>	<p>Pull the water tray upwards, and then remove the water tray.</p>  <p>Water Tray</p>
<p>13. Remove connection pipe between indoor and outdoor units</p>	<p>Separate the connection pipe between indoor and outdoor units.</p>  <p>Connection position for indoor and outdoor units' connection pipe</p>

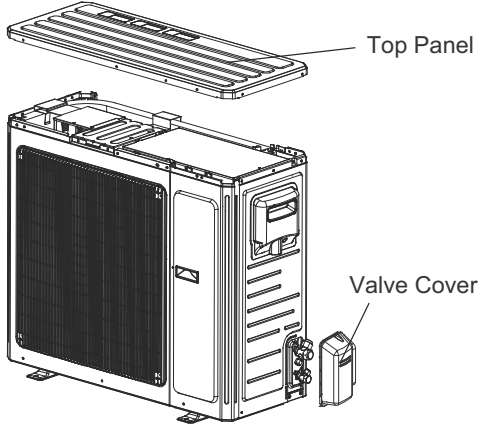

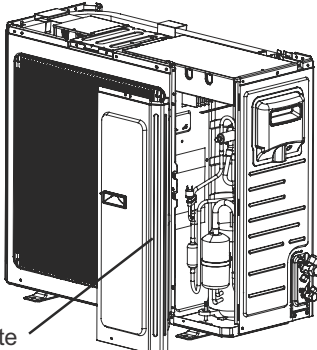

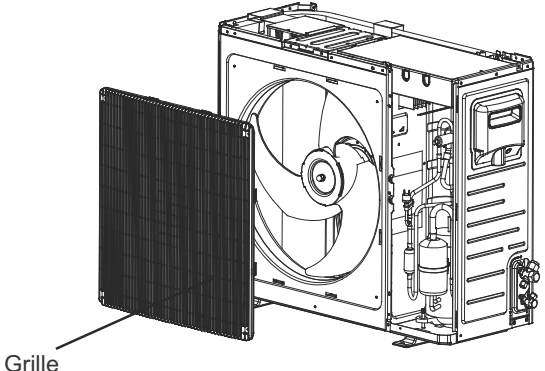

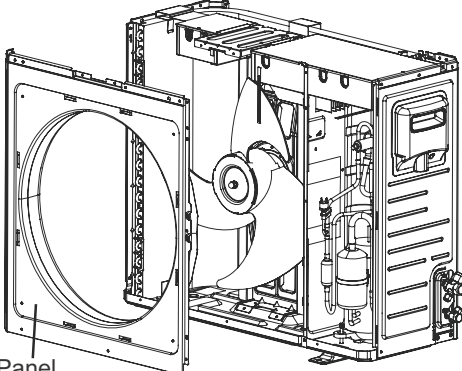

STEPS	PROCEDURES
<p>14. Remove pipe-stopping plate</p>	<p>Remove two screws on pipe-stopping plate for indoor unit, and then remove the pipe-stopping</p>  <p>Pipe-Stopping Plate</p> <p>Screw</p>
<p>15. Remove damping board</p>	<p>Remove 2 screws on damping board, and then remove the damping board.</p>  <p>Screw</p> <p>Damping Board</p>
<p>16. Remove evaporator</p>	<p>a. Remove screws between evaporator and bottom case.</p>  <p>Screw</p> <p>b. Turn over the indoor unit and adjust the pipe line to the position as shown by the broken line.</p>  <p>c. Lift up the evaporator, and then remove the evaporator.</p>  <p>Evaporator</p>
<p>17. Remove the fixing plate of motor</p>	<p>Remove 2 screws on fixing plate of motor, and then remove the fixing plate of motor.</p>  <p>Screw</p>

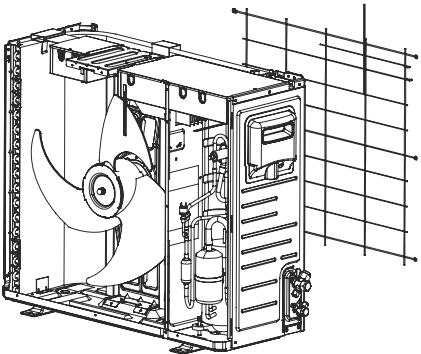

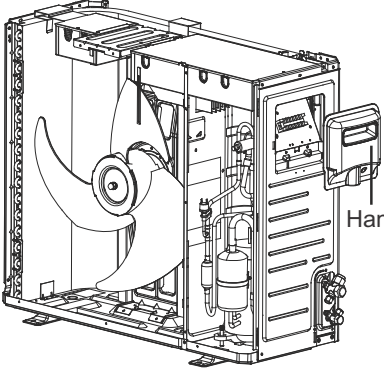

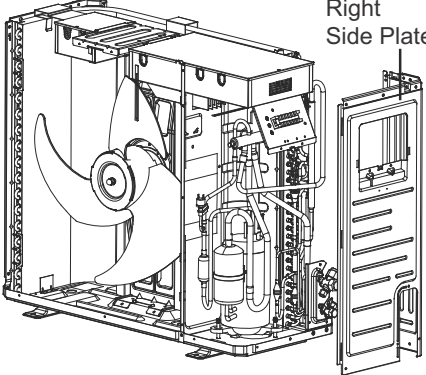

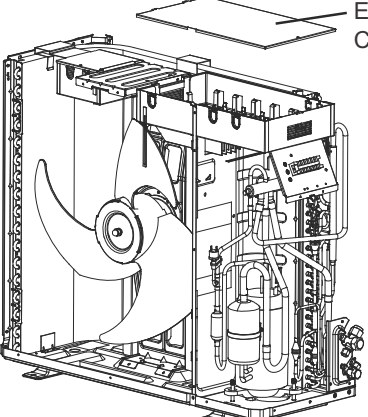

STEPS	PROCEDURES
<p>18. Remove cross flow blade and motor</p>	<p>a. Remove screws fixing cross flow blade and motor.</p>  <p>b. Remove the motor sub-assy.</p>  <p>c. Separate two cross flow blade.</p> 
<p>19. Remove cushion rubber</p>	<p>a. Remove the cushion rubber on cross flow blade.</p>  <p>b. Remove the cushion rubber from the base.</p> 

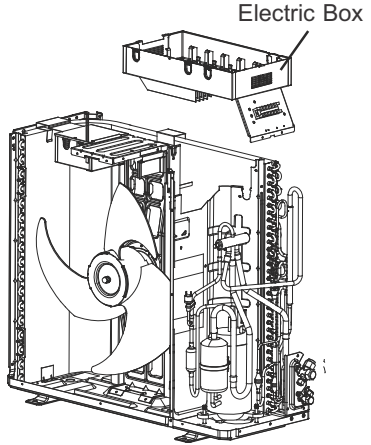

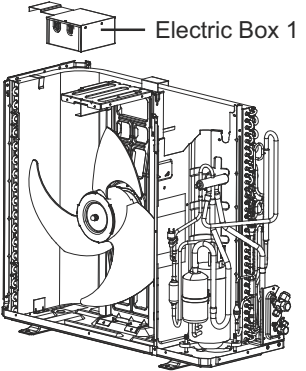

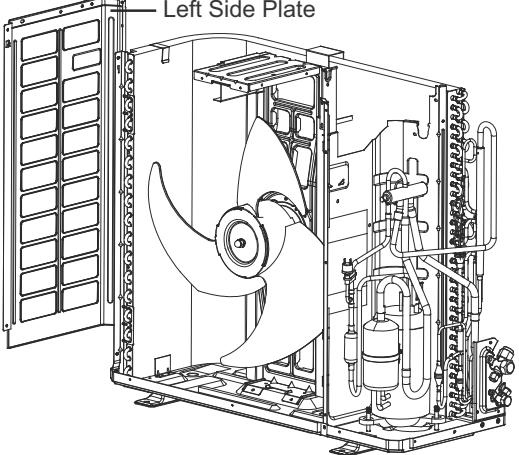

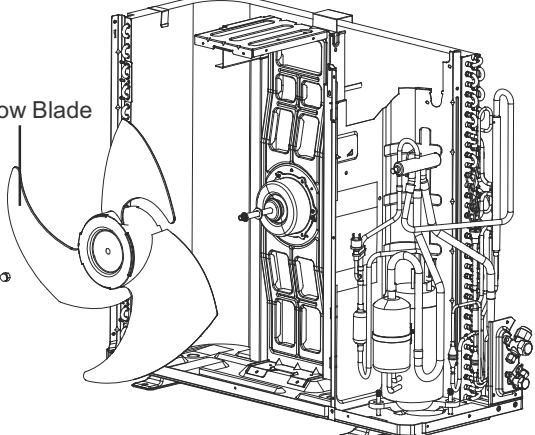

Removal Procedure of Outdoor Unit

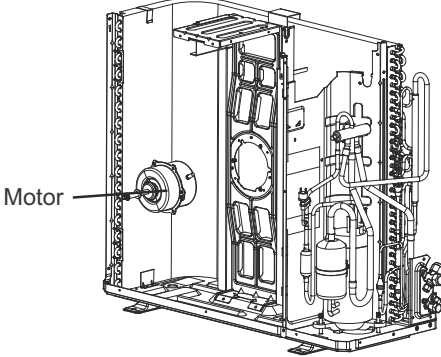

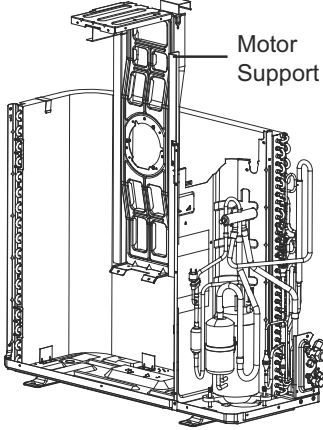

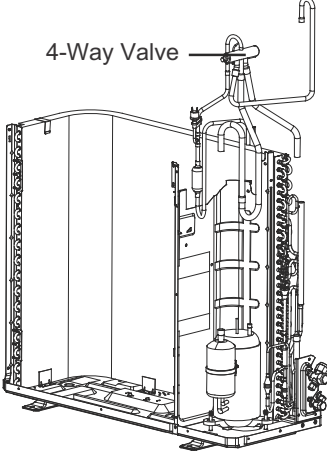

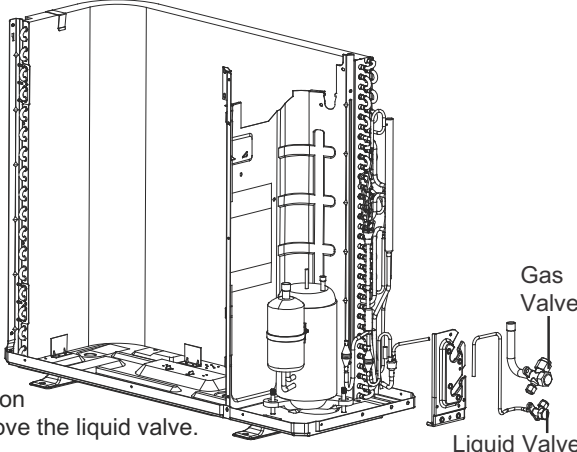

WARNING

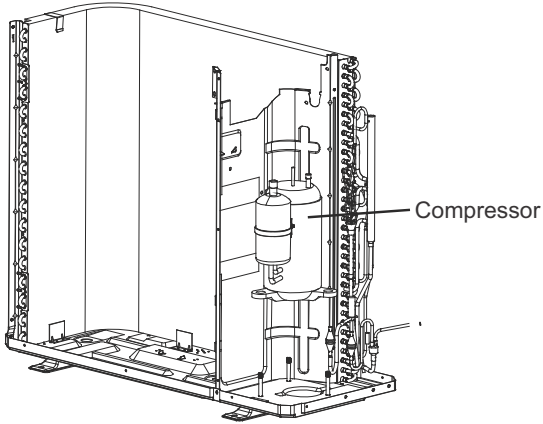

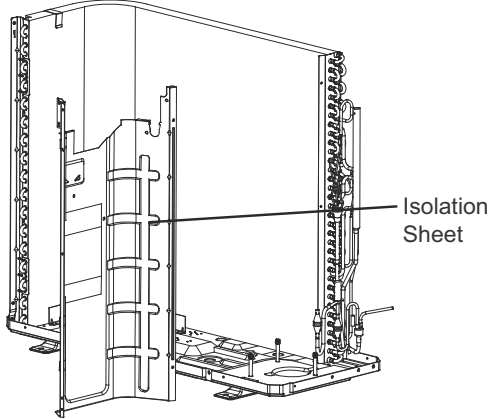

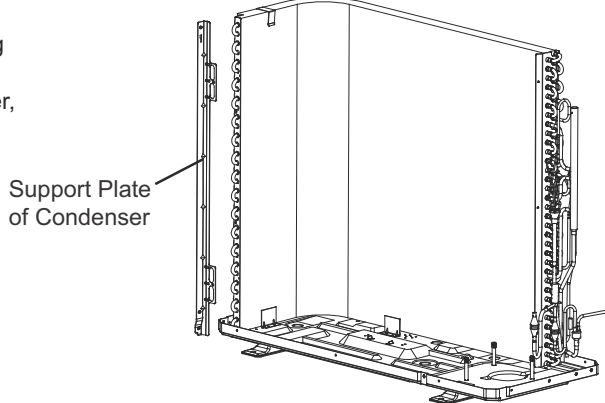

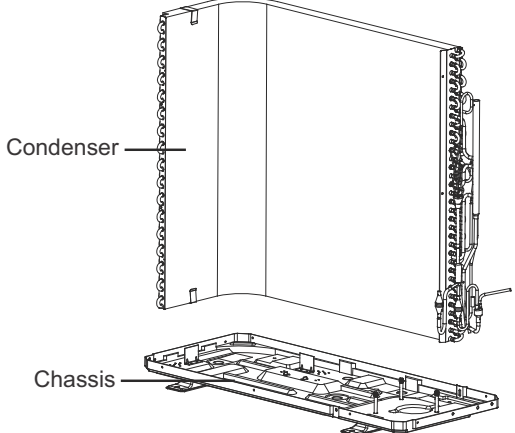

Be sure to wait for a minimum of 10 minutes after turning off all power supplies before disassembly.

STEPS	PROCEDURES
<p>1. Remove top cover and front side plate</p>	<p>a. Use the screwdriver to remove the screws connecting the top panel and panel and side panels. Remove the top panel. Loosen the screws fixing the valve cover and then remove the valve cover.</p>  <p>b. Loosen the screws connecting the front side panel and mask and chassis. Remove the front side panel.</p> 
<p>2. Remove grille</p>	<p>Twist off the screws connecting the grille and panel, and then remove the grille.</p> 
<p>3. Remove panel</p>	<p>Twist off the screws connecting the panel, chassis and motor support with screwdriver, and then remove the panel.</p> 

STEPS	PROCEDURES
<p>4. Remove guard grille</p>	<p>Twist off the screws fixing the guard grille and then remove the guard grille.</p>  <p style="text-align: right;">Guard Grille</p>
<p>5. Remove handle</p>	<p>Twist off the screws fixing the handle and then remove the handle.</p>  <p style="text-align: right;">Handle</p>
<p>6. Remove right side plate</p>	<p>Twist off the screws connecting the right side plate and chassis, valve support and condenser, and then remove the right side plate.</p>  <p style="text-align: right;">Right Side Plate</p>
<p>7. Remove electric box</p>	<p>a. Twist off the screws on electric box cover with screwdriver, and then remove the electric box cover.</p>  <p style="text-align: right;">Electric Box Cover</p>

STEPS	PROCEDURES
<p>7. Remove electric box (Continued)</p>	<p>b. Twist off the screws on electric box, cut off the tieline with scissors or pliers, pull out the wiring terminal, pull it upwards to remove the electric box.</p>  <p>Electric Box</p> <p>c. Twist off the screws between electric box 1 and left side plate with screwdriver, pull it upwards to remove the electric box 1.</p>  <p>Electric Box 1</p>
<p>8. Remove left side plate</p>	<p>Twist off the screws connecting the left side plate and chassis with screwdriver, and then remove the left side plate.</p>  <p>Left Side Plate</p>
<p>9. Remove axial flow blade</p>	<p>Twist off the nuts on blade with wrench and then remove the axial flow blade.</p>  <p>Axial Flow Blade</p>

STEPS	PROCEDURES
<p>10. Remove motor and motor support</p>	<p>a. Twist off the tapping screws fixing the motor, pull out the pin of leading wire for motor and then remove the motor.</p>  <p>b. Twist off the tapping screws fixing the motor support, pull it upwards and then remove the motor support.</p> 
<p>11. Remove 4-way valve</p>	<p>Unsolder the pipeline between compressor, condenser, gas and liquid valve, and then remove the 4-way valve. (note: release all refrigerant before unsoldering).</p> 
<p>12. Remove gas valve and liquid valve</p>	<p>Twist off the 2 bolts fixing the valve sub-assy. Unsolder the soldering joint between gas valve and air-return pipe and then remove the gas valve. (note: when unsoldering the soldering joint, wrap the gas valve with wet cloth completely to avoid the damage to valve, and release all refrigerant completely at first). Unsolder the soldering joint between liquid valve and connection pipe of liquid valve, and then remove the liquid valve.</p> 

STEPS	PROCEDURES
<p>13. Remove compressor</p>	<p>Twist off the 3 foot nuts on compressor and then remove the compressor.</p> 
<p>14. Remove isolation sheet</p>	<p>Twist off the screws connecting isolation sheet and end plate of condenser and chassis, and then remove the isolation sheet.</p> 
<p>15. Remove support plate of condenser</p>	<p>Twist off the screws connecting the support plate of condenser and condenser with screwdriver, and then remove the support plate of condenser.</p> 
<p>16. Remove chassis and condenser</p>	<p>Pull it upwards to separate the chassis and condenser.</p> 

ACCESSORIES

PART NUMBER	DESCRIPTION
OTHER ACCESSORIES	
S1-DL30510050	Remote Control
S1-DL26150003	Remote Control Holder
S1-DL11200511	Catechin Filter
S1-230-DL16	5/8" Drain Line
MOUNTING ACCESSORIES	
S1-1836-2	PAD,UNIT,ECOPAD,18X36X2 (M50)
S1-ACP1836-2	PAD,UNIT,DURAGRID,18X36X2 (M50)
